## **DPI-SIG PHOTOGRAPHERS FOR NON-PROFIT ORGANIZATIONS**

**Joe Bucherer**, Director of Photographers for Non-Profit Organizations, suggests when you see an email requesting a photographer for a non-profit event, don't be afraid to volunteer and give back to the community. We do not accept every organization that asks for photographers. Joe and the committee thoroughly check to make sure the organization is non-profit before committing our talent and time! However, once you volunteer for the experience, the personal rewards are priceless! Below are two such opportunities!

### **American Heart Association Walk**

The American Heart Association has worked with us in the past and is holding walks in November and December (dates below). We'd like two photographers - one to take large team photos and the other taking active participant shots, sponsorship tents, signs, etc.

- Collier at Cambier Park November 5, 2022 8 a.m.-11 a.m.
- Lee at Centennial Park December 10, 2022 8 a.m.-11 a.m.

This is a great outdoor event opportunity for someone looking to try their hand at candid photography.

The contact at the American Heart Association is **Jaelyn Bevis** @ 317.809.1705 or [Jaelyn.Bevis@heart.org](mailto:Jaelyn.Bevis@heart.org).

If you volunteer your time, please be sure to let Joe know: [jbucherer@gmail.com](mailto:jbucherer@gmail.com) .

## GLOSSARY TERM

**NOVEMBER - GLOSSARY TERM:** **Asymmetrical Balance:** There are several types of compositional balance techniques that can affect the outcome of a photograph. These include radial balance, symmetrical balance, mosaic balance, and asymmetrical balance. Asymmetrical balance is one of the most common examples of balanced compositions. It's created by placing two opposing or dissimilar objects in the same frame, resulting in an unequal visual weight in the composition, such as a large dominant object balanced by a smaller object on the other side.

**OCTOBER - GLOSSARY TERM:** **Bicubic Interpolation:** is a 2D system of using cubic splines or other polynomial technique for sharpening and enlarging digital images. It is commonly used in computer image editing software, by retouchers and editors when upscaling or resampling an image. When we interpolate an image, we are actually distorting the pixels from one grid to another. There are 2 common interpolation algorithms, adaptive and non-

adaptive. The adaptive methods depend on what they are interpolating, whereas non-adaptive methods treat the pixels equally. Adaptive algorithms are used in many proprietary techniques in specialized professional image editing software like Photozoom Pro and Adobe Photoshop. Non-adaptive algorithms include the following: nearest neighbor, bilinear, bicubic, spline (to name a few). In image processing, bicubic interpolation is often chosen over bilinear or nearest-neighbor interpolation in image resampling, when speed is not an issue. In contrast to bilinear interpolation, which only takes 4 pixels (2×2) into account, bicubic interpolation considers 16 pixels (4×4). Images resampled with bicubic interpolation are smoother and have fewer interpolation artifacts.
